## **PREFACE.**

This bulletin is no more than a compilation, with some analysis, of the existing authoritative data on changes in cost of living since the beginning of the European War in July 1914. Inasmuch, however, as these data are at present scattered thru a large number of publications it is believed the assembling of them under a single cover, in summarized form, will be of service at the present time when there is so much demand for information on this subject.

The greater portion of the material here used is derived from publications of the United States Bureau of Labor Statistics, for the very good reason that that Bureau is the only organization which over a period of years has been collecting cost of living and price data on a comprehensive scale and in a scientific manner.

*Addendum*

WHOLESALE PRICE CHANGES, SEPTEMBER 1919

Since this bulletin went to press, the index numbers of Bradstreet and Dun for September 1919 and of the Annalist for the first two weeks of September 1919 have become available. These are of particular interest as indicating a decline in wholesale prices. The following table shows the above index numbers for September in comparison with June, July and August.

WHOLESALE PRICE INDEX NUMBERS FOR 4 MONTHS ENDING SEPTEMBER 1919.

(All figures have been computed on basis of data for 1913=100.)

Year and Month	Bradstreet	Dun	Annalist
1919			
June.....	196	189	216 Average for Month.
July.....	205	193	218 Average for Month.
August.....	217	201	219 Average for Month.
September.....	212	198	206 Week ending September 6th. 204 Week ending September 13th.

# CHANGES IN COST OF LIVING

## Chapter 1.

### SUMMARY OF INCREASED COST OF LIVING, JULY 1914 TO AUGUST 1919.

1. A careful analysis of existing data indicates that the increased cost of living in the United States, by six month periods, from the beginning of the European War in July 1914 to June 1919 has been as indicated in the table below. The table presents figures for (1) the shipbuilding centers where industry was most stimulated, and population most congested, with a consequent tendency to price raising, (2) other cities, both large and small; and (3) the country as a whole. A detailed explanation of the manner in which the data presented were arrived at is given in the following pages.

TABLE 1.  
PER CENT OF INCREASE IN COST OF LIVING SINCE JULY 1914.

	18 shipbuilding centers.	Other cities and towns.	Country as a whole (excluding agricultural communities)
Dec. 1914.....	2	2	2
June 1915.....	2	2	2
Dec. 1915.....	3	3	3
June 1916.....	9	9	9
Dec. 1916.....	17	17	17
June 1917.....	30	27	29
Dec. 1917.....	44	39	41
June 1918.....	60	53	56
Dec. 1918.....	76	67	72
June 1919.....	80	70	75
August 1919 (based on incomplete data).....	---	---	78

Since June 1919 there are no figures of comparable accuracy with those of preceding dates. It seems clear, however, from the existing data that cost of living rose at least 3 points more by August. Thus the National Industrial Conference Board survey for July shows a rapid rise in July after a decline in the spring. Retail food prices of the U. S. Bureau of Labor Statistics show an increase of 3% on July 15 over June 15. The Bureau of Labor Statistics' wholesale price index shows a sharp rise in July over June. The Annalist wholesale food index figures (averaged for the month) show an increase of about 1 per cent for July over June and of one-half of one per cent for August over July. Bradstreet's index number shows an increase of 4.4 per cent on July 1 over June 1, and of 5.9 per cent on August 1 over July 1. Dun's index number of wholesale prices shows a similar result.

In view of these indications it would appear that the general cost of living increased approximately 3 percentage points in August as

compared with June. On the other hand it is of interest to note the Annalist wholesale food index number showed a decline in the latter weeks of August and the first week of September.

*Data upon which above estimates are based.*

2. The determination of changes in the cost of living, to be at all accurate, must be based upon the retail costs of the various items entering into the ordinary family budget, weighted according to the importance of such items in the budget. This includes house rent, sickness expenses, amusements, and other more or less intangible things, as well as actual commodities such as food and clothing. For this reason prices of commodities as the term is usually used, whether wholesale or retail, do not constitute a complete index of cost of living. Thus prices of food, fuel and clothing may go up 100 per cent, but if rent and sundries (which take about one-third of the average family's income) advance, say, only 10 per cent, the real increase in cost of living will be less than 70 per cent.

3. Retail prices of food offer a good guide to changing living costs, but cannot be taken as conclusive as food is only one item, altho an important one, in the family budget.

4. Wholesale prices offer a very unsatisfactory guide to living costs. Experience has shown that during a period of rapidly rising prices, such as has occurred during the past five years, wholesale prices tend to increase considerably more rapidly than retail prices. There are two evident reasons for this: first, the retailer often buys on contract for future delivery and, second, the retailer is often unable to shift the increased wholesale cost immediately to the consumer. Thus, in a period of increasing costs, retail prices, and it is at retail that the average consumer buys, tend to lag behind wholesale prices. Ultimately retail prices will show somewhat the same total increase as wholesale prices will but, on any particular date, in a period of generally increasing prices, wholesale prices may be several points in advance of retail prices.

Moreover the existing data regarding wholesale price movements are not entirely satisfactory. There are five well known index numbers of such prices---Bradstreet's, Dun's, the Annalist's, Gibson's and the U. S. Bureau of Labor Statistics, (See Chapter 6 for these index numbers in full). These are based on different groupings of commodities and are by no means identical in their results.

5. Comprehensive studies of cost of living, of the character mentioned in Section 2, are only two in number: (1) Cost of Living Survey of 18 Shipbuilding Centers from December 1914 to June 1919, made by the U. S. Bureau of Labor Statistics, and supplemented by a country wide cost of living survey, covering similar surveys for (a) thirteen other large non-shipbuilding centers from December 1917 to June 1919, and (b) sixty-six additional cities, mostly of smaller size, from December 1917 to December 1918, and (2), Cost of Living Survey of the National

Industrial Conference Board, (See Chapter 2 for details of these surveys).

In the Bureau of Labor Statistics' surveys, detailed expenditures over a year's time were obtained from several hundred families in each community. From these were determined the relative importance of each article in the list of expenditures. The local retail prices were then obtained and weighted according to their importance in the budget, for December of each of the years, 1914, 1915, 1916, 1917, 1918 and for June 1919.

In the cost of living survey of the United States Industrial Conference Board the prices obtained were similarly weighted, the results of previous investigations being used for this purpose. In obtaining prices, the Board used the retail food prices published by the U. S. Bureau of Labor Statistics. For other items it obtained prices direct from the localities, mostly by correspondence. Its original investigations covered the months of July 1914, June and November 1918, and March and July 1919.

6. The making of cost of living surveys, such as those just listed is very laborious. It means collecting prices of food, clothing, house furnishings, house rents, etc. from a large number of dealers in a large number of localities. As a result, such price collecting has only been done at considerable intervals and for a more or less limited number of communities. Thus there is no complete series of figures showing changes in cost of living for all communities and at short intervals. Therefore, in attempting to arrive at a complete series of figures showing changes in cost of living during the period, July 1914 to date, the best that can be done is to combine and analyze the existing data and to seek to reconcile conflicting findings and fill in lacking data as well as possible.

7. The paramount difficulty is that, during the past few years, there has been considerable lack of uniformity in the increasing cost of living in different cities and different sections. From 1914 to date, every community of which there is record shows a very substantial increase, but the percentages were by no means the same. Thus, from December 1914 to June 1919 the increase in the 18 shipbuilding centers varied from 65 per cent in Los Angeles, California, to 87 per cent in Norfolk, Virginia.

This fact explains in some part the different results obtained by different investigations. Thus, not infrequently the statement is made that the cost of living has increased 100 per cent since the war began. This may well be true for certain communities or certain groups of families; while for other communities and other groups of families the increase may have been very much less.

Because of these wide variations between communities, it might very well be contended that each community, or at least each group of similar communities must be dealt with separately and that no average for the country as a whole can be derived which is not a mere abstraction.

This is, in strict logic, perfectly true, and for certain purposes, such as local wage adjustments, cost of living data may be completely satisfactory only when they are based on investigations in the particular locality. Nevertheless for other purposes, such as wage adjustments on a national basis, there is imperative need of, and much practical usefulness in so combining the local experience as to produce an average for the country as a whole. But, just because such an average is a combination of greatly varying elements, it is highly important that the basic data be thoroughly representative, that, in other words, original data be obtained from a large number of communities of diverse character.

*The Increase in Cost of Living from July 1914 to December 1914.*

8.. No precise information exists regarding this period, the Bureau of Labor statistics' comprehensive studies not beginning until December 1914, and the National Industrial Conference Board's study jumping (as far as regards original investigations) from July 1914 to June 1919.

The available information, therefore, is limited to retail food prices of the U. S. Bureau of Labor Statistics (see Chapter 4) and the wholesale price index numbers of Bradstreet, Dun, etc. (See Chapter 6). These show that from July to December 1914 retail food prices increased 3 per cent, and wholesale prices of all commodities, according to Bradstreet and Dun, increased 4 per cent, while Gibson's index numbers give an increase of 7 per cent, the Annalist an increase of only 1 per cent and the U. S. Bureau of Labor Statistics' index shows a decrease. In view of this evidence, and giving chief weight to the food prices, it appears that the increase in cost of living from July to December 1914 did not exceed 3 per cent, and was probably less, inasmuch as rent and several other items in the family budget probably did not increase at all during this period. Therefore, a liberal estimate of increase in cost of living between these two dates would be 2 per cent, and this figure has been accepted in the present study.

*The Increase in Living Cost from July 1914 to July 1919.*

9. The Bureau of Labor Statistics' study for 18 shipbuilding centers shows an increase in cost of living for these cities of 77 per cent from December 1914 to June 1919. (See Chapter 2.). As there was approximately a two per cent increase from July to December 1914 (as computed in the preceding paragraph) this would mean a total increase of about 80 per cent from July 1914 to June 1919. The National Industrial Conference Board's study shows an increase of 71 per cent from July 1914 to July 1, 1919. An analysis of these two findings indicates they are not as far apart as they might seem at first sight.

Of the two studies, that of the Bureau of Labor Statistics was unquestionably done with the greater thoroughness and accuracy. This particular study of the Bureau's, however, covered only shipbuilding

centers, where all the evidence points to the fact that the price increases, owing to extraordinary industrial activity and population congestion, were greater than in other communities. The Board's study covered most of the shipbuilding cities but in addition included a number of smaller and industrially less active cities where price and rent increases were, on the whole, probably less marked. This in itself would tend to make the average arrived at by the Conference Board's study for the whole country (namely 71 per cent from July 1914 to July 1919) less than the average of the 18 shipbuilding centers (namely 80 per cent for substantially the same period).

10. Supporting evidence on this point may be derived from the Bureau of Labor Statistics' two supplementary cost of living surveys for other than shipbuilding cities--namely, for 13 large cities from December 1917 to June 1919, and for 66 cities, mostly of smaller size, from December 1917 to December 1918. The periods covered by these supplementary studies were too short to permit of direct conclusions regarding the course of cost of living figures for these two groups of cities during the 5 years covered by the shipbuilding study and the Conference Board's study. The data, however, are sufficient not only to indicate that the increase in the cost of living in the shipbuilding centers was greater than in the two other groups of cities but also to indicate, with some precision, the degree in which it was greater. This is brought out in the following table which compares the results of the two supplementary studies with the results of the original survey of the 18 shipbuilding centers for the limited period for which they are comparable.

	Per Cent Increase over Decem- ber 1917.	
	Dec. 1918	June 1919
(1) 18 shipbuilding cities.....	22	25
(2) 13 other large cities.....	19	22
(3) 66 additional cities.....	18	..

Two points are to be noted in this table:

First, that from December 1917 to December 1918 the rapidity of increase in cost of living was but little greater in group 2 (the 13 large cities, not shipbuilding centers) than in group 3, which covered 66 additional cities, most of which are of smaller size--the full percentages being 18.59 and 18.14 respectively. Either of these groups may therefore be taken as fairly representative of conditions in the country outside the shipbuilding centers.

Second, that in the shipbuilding centers the increase in cost of living for the period shown was more rapid than in the other towns and cities. Thus commodities which, in December 1917, cost \$100, would cost in December 1918, about \$122 in the shipbuilding centers and only \$118

to \$119 in other cities and towns; and in June 1919 would cost about \$125 in the shipbuilding centers and only about \$122 in other cities and towns. This indicates a rapidity of increase in the shipbuilding centers greater by about 12 per cent than in other communities.

On the other hand, as the great stimulus to shipbuilding did not begin until 1917 it may be assumed that prior to 1917 the increase in living cost was no greater in the actual or potential shipbuilding communities than in other communities. Assuming, therefore, that up to the end of 1916 increases in living costs were the same in both groups of communities and that thereafter the increase was 12 per cent greater in shipbuilding centers, it would appear that from Dec. 1914 to July 1919 the total increase in cost of living in non-shipbuilding communities was approximately 70 per cent as against 80 per cent for the shipbuilding centers. The same method, of course, can be applied to the intervening years.

11. Thus are developed two series of cost of living increase figures based on the investigations of the U. S. Bureau of Labor Statistics, one applying only to shipbuilding centers, and the other, lower by 12 per cent, applying to other urban communities. (For the strictly agricultural communities there is no information available).

12. A further step may be made by combining the two series of figures thus developed in order to obtain an average for the country as a whole. Inasmuch as the 18 shipbuilding centers here dealt with contain almost one-half the urban population of the United States, a flat average of the two sets of figures would produce the desired figure. This combination is made in the following table, which shows

1. Index numbers of cost of living in shipbuilding centres, with the base changed from December 1914 to July 1914 on the assumption of a two per cent increase between these dates, as explained in Section 8 above.
2. Index numbers for other cities and towns, on the assumption that cost of living therein increased 12 per cent less rapidly than in shipbuilding communities.
3. A combined average of the two columns.

TABLE 2.

	18 shipbuilding centers (Base changed to July 1914)	Other cities and towns (On assumption of prices therin having increased since 1916 12 per cent less rapidly than shipbuilding centers).	United States (A mean between columns 1 and 2)
July 1914.....	100.0	100.0	100.0
Dec. 1914.....	102.0	102.0	102.0
Dec. 1915.....	102.5	102.5	102.5
Dec. 1916.....	117.1	117.1	117.1
Dec. 1917.....	143.9	138.6	141.2
Dec. 1918.....	176.0	166.9	171.5
June 1919.....	180.0	170.4	175.2

13. The figure of 75 per cent increase in living cost from July 1914 to June 1919 thus arrived at is four points higher than the figure arrived

at by the National Industrial Conference Board—71 per cent from July 1914 to July 1919. It is believed that the former figure is the more nearly representative of conditions in the country as a whole. The study made by the National Industrial Conference Board was carefully done, but (with the exception of food prices) most of the prices and rent data was gathered solely by correspondence with clothing stores, real estate dealers, etc. and it is believed that any error resulting from this method of collecting data would be on the side of unduly conservative quotations.

*Estimates of Increases, by Half Yearly Periods, 1914 to 1919.*

14.. The above computations, based solely on the investigations of the Bureau of Labor Statistics, cover, prior to 1919, the single month of December. For intermediate months, no such precise information exists and an attempt to fill such gaps must be by way of estimate and interpolation. The simplest method of estimating is to assume that the increase from one known month to another is at a uniform monthly rate; thus, if the increase between December of one year and December of another is 12, to assume that there was a uniform increase of 1 point each month, which would make the increase up to June 6 per cent. This method is of course not strictly accurate, as increasing prices may proceed by "jumps", with a tendency toward a "sag" in the summer months, altho in the past few years of extraordinary price changes even this usual summer "sag" has not occurred at all regularly.

15.. In the table below, this method is applied for a selected month—June - of each year. The results are given in column one, which repeats the estimated index numbers of cost of living for the United States as a whole for the months covered by the original investigation of the U. S. Bureau of Labor Statistics. As a means of checking these figures, the data of the National Industrial Conference Board are presented in column 2 and the retail food price index numbers in Column 3. These two sets of figures seem to corroborate the estimates as made. Further corroboration is supplied by the wholesale price index numbers which, for reasons pointed out in Section 4 above, can only be used as evidence regarding price movements and cannot be accepted as showing the amount of change in the cost of living.

TABLE 3.  
INDEX NUMBERS OF INCREASED LIVING COSTS FOR UNITED STATES,  
JULY 1914 to JULY 1919.  
(Based on data of the U. S. Bureau of Labor Statistics).

	Estimated index numbers. Based on surveys made by U. S. Bureau of Labor Statistics	Data of National Industrial Conference Board	Retail Food Prices (U. S. Bureau of Labor Statistics)
July 1914.....	100	100	100
Dec. 1914.....	102	101	103
June 1915.....	102	101	98
Dec. 1915.....	103	...	103
June 1916.....	109	109	110
Dec. 1916.....	117	...	124
June 1917.....	129	132	149
Dec. 1917.....	141	15	154
June 1918.....	156	...	159
Dec. 1918.....	172	...	183
June 1919.....	175	...	180
July 1919.....	...	171	186

The percentage change between the estimated index numbers for any two months in the above table can be found by dividing the difference between the two numbers by the lower number. The following show such percentages for selected periods:

Dec. 1914 over July 1914.....	2	per cent
Dec. 1915 over July 1914.....	3	" "
Dec. 1917 over July 1914.....	41	" "
Dec. 1917 over Dec. 1915.....	38	" "
June 1919 over July 1914.....	75	" "
June 1919 over Dec. 1915.....	70	" "
June 1919 over Dec. 1917.....	24	" "
June 1919 over June 1918.....	12	" "

## Chapter 2.

### GENERAL SURVEYS OF CHANGING COST OF LIVING.

The only studies of changes in the general cost of living, as distinguished from price changes of particular items in the family budget, are those made (1) by the U. S. Bureau of Labor Statistics and (2) by the National Industrial Conference Board.

#### *Cost of Living Surveys of the United States Bureau of Labor Statistics.*

1. The most comprehensive study of changing cost of living during the war period is that of the U. S. Bureau of Labor Statistics for 18 shipbuilding centers. The study originated as a result of the demand of the Shipbuilding Labor Adjustment Board of the Emergency Fleet Corporation for authoritative data on changing living costs, as a basis for periodic adjustment of wages in the shipyards. For this reason the study was limited to distinctly shipbuilding centers. The 18 cities covered are Portland, Maine; Boston; New York; Philadelphia; Baltimore; Norfolk; Savannah; Jacksonville; Mobile; Houston; Chicago; Detroit; Cleveland; Buffalo; Portland, Oregon; Seattle; Los Angeles; and San Francisco.

This study was based entirely upon original investigations by agents of the Bureau. Detailed family schedules were gathered from several hundred families in each city and from these was obtained the information regarding quantities of each article purchased necessary for a proper weighting of the various items of the budget. Thereupon price data for each of these items were obtained for December of each year from 1914 to 1918 and for June 1919. The resulting tabulations give a properly weighted and accurate measure of changing cost of living in each of these important centers over the period December 1914 to June 1919.

Supplementing this basic study the Bureau of Labor Statistics made a general cost of living survey covering (1) 13 large cities, not shipbuilding centers, for December 1917, December 1918 and June 1919; and (2) 66 other cities, mostly of smaller size, for December 1917 and December 1918. These two studies cover a much shorter period than that of the 18 shipbuilding centers, but are very valuable as they make possible a means of comparing the increased living cost in highly active industrial cities with that in other cities where industry was not so much stimulated by the war.

A fairly detailed summary of each of these three surveys is given in the following sections.

*A. Survey of 18 Shipbuilding Centers, December 1914 to July 1919.*

This survey, as noted above, was undertaken by the United States Bureau of Labor Statistics specifically for the use of the Shipbuilding Labor Adjustment Board of the Emergency Fleet Corporation and for that reason was limited to shipbuilding centers. It covered 18 large cities of wide geographical distribution and containing between fifteen and twenty million people.

The following tables show the percentage increase in cost of living for December of each year from 1914 to 1918, and for June 1919, as developed in this survey. The first table (Table 4) gives the total per cent increases for each city and by years, for all items combined. The second table (Table 5) gives, for each city, the per cent increases from December 1914 to June 1919 by principal expenditure groups.

TABLE 4.

PERCENTAGE OF INCREASE IN COST OF LIVING IN 18 SHIPBUILDING CENTERS  
FROM DECEMBER 1914 TO DECEMBER 1915, 1916, 1917, AND 1918,  
AND TO JUNE 1919.

(Compiled from data published in the Monthly Labor Review of the U. S. Bureau of Labor Statistics).

Cities.	Percentage of increase from December 1914 to-

*B. Survey of 13 Large Non-shipbuilding Cities, December 1918 to June 1919.*

The cities covered by this survey are for the most part large inland cities. Industry in many of them was greatly stimulated by the war but in few if any cases did they experience the heavy labor influx and housing congestion experienced by the shipbuilding centres. The first of the two following tables (Table 6) gives for each city, the percentage increase in cost of living from December 1917 to December 1918 and to June 1919 for all items combined. The second table (Table 7) gives, for each city, the per cent increases from December 1917 to June 1919 by principal expenditure groups.

TABLE 6.

PERCENTAGE OF INCREASE IN COST OF LIVING IN 13 LARGE NON-SHIPBUILDING CENTERS FROM DECEMBER 1917 TO JUNE 1919.

(Compiled from data published in the Monthly Labor Review of the U. S. Bureau of Labor Statistics).

CITIES.	Per Cent Increase from December 1917 to	
	December 1918	June 1919
Atlanta, Ga. . . . .	19.63	23.27
Birmingham, Ala. . . . .	16.98	19.78

*C. Survey of 66 Other Cities, December 1917 to December 1918.*

The cities covered by this survey were, on the whole, the smaller cities of the country, and the results obtained may therefore be taken as fairly

representative of cost of living changes in such places. Unfortunately the published data for these cities cover only a single year, December 1917 to December 1918. The following table (Table 8) shows for each of these cities the per cent of increase for December 1918 over December 1917, for each of the principal groups of items.

TABLE 8.

PERCENTAGE OF INCREASE IN COST OF LIVING IN 66 CITIES FROM DECEMBER 1917 TO DECEMBER 1918, BY PRINCIPAL EXPENDITURE GROUPS.

## 2. Cost of Living Study of National Industrial Conference Board.

Other than the surveys made by the U. S. Bureau of Labor Statistics the only important study of changes in the general cost of living during the war is that made by the National Industrial Conference Board. This study covers the period from July 1914 to July 1919, and is based on original investigations except that in the matter of retail food prices the price data of the U. S. Bureau of Labor Statistics have been accepted.

The results of this continuing study of the Board have been published in a series of reports. The data were summarized, up to March 1919, in Research Report No. 17 of that Board (p. 29). The following table reproduces that summary, with the addition of data for July 1919, taken from the "Advance Report of the National Industrial Conference Board on Changes in Cost of Living, July 1914 - July 1919," issued by the Board in July.

TABLE 9.

ESTIMATED AVERAGE INCREASES IN THE COST OF LIVING BETWEEN JULY 1914 AND THE MIDDLE OF EACH OF THE YEARS 1915, 1916, AND 1917, AND AT SPECIFIED DATES IN 1918 AND 1919.<sup>a</sup>

Budget Items	Percentage of total expenditures	Percentage of increase above 1914 prices.						
		1915	1916	1917	1918		1919	
					June	Nov.	March	July
All Items.....	100.0	.5	<u>8.7</u>	<u>31.7</u>	52.3	65.9	61.3	70.8
Food.....	43.1	b	11	46	62	83	75	85
Shelter.....	17.7	b	<u>1.5</u>	<u>5</u>	15	20	22	28
Clothing.....	13.2	3	<u>20</u>	<u>43</u>	77	93	81	100
Fuel, heat and light...	5.6	2	5	<u>33</u>	45	55	57	57
Sundries.....	20.4	b	<u>4</u>	<u>17</u>	50	55	55	63

a. Averages that are underscored for 1915, 1916 and 1917 are, with the exception of food, estimated from the best available data.

b. No Change.

The "Advance Summary" here referred to constitutes such a good brief explanation of the methods followed by the National Industrial Conference Board in obtaining and interpreting its price data that it is reproduced here in full.

### Changes in the Cost of Living July 1914 --- July 1919. Advance Summary.

(Published by the National Industrial Conference Board, Boston, Mass.)

The cost of living for American wage-earners was 71% higher in July, 1919, than at the outbreak of the world war in July, 1914, according to a preliminary statement issued by the National Industrial Conference Board based on a careful survey of conditions the country over. This represents an advance of 6% since March, 1919, and of 12% since June, 1918. The increase of 71% to July, 1919 makes the highest point yet

reached and compares with an increase of 61.3% to March, 1919; of 65.9% to November, 1918, and of 52.3% to June, 1918.

The total increase for the five-year period since the beginning of the war in the average cost of each of the principal items entering into the family budget was:

<i>All items</i> .....	70.8%
Food.....	85%
Shelter.....	28%
Clothing.....	100%
Fuel, heat, and light.....	57%
Sundries.....	63%

Increases since last March were as follows:

<i>All items</i> .....	5.9%
Food.....	5.7%
Shelter.....	4.9%
Clothing.....	10.5%
Fuel, heat, and light.....	No change
Sundries.....	5%

In combining these separate items to obtain the increase in the budget as a whole, account has been taken of the fact that approximately 43% of the income of the average wage-earner's family is spent for food; 18% for shelter; 13% for clothing; 6% for fuel, heat and light; and 20% for sundries. This distribution is based on studies of the expenditures of a large number of families made by the United States Bureau of Labor Statistics and other authoritative government and private agencies. The method of computing the change in the cost of living on the basis of the increases found for the separate items by the National Industrial Conference Board is shown below:

Budget items	Relative importance in family budget	Increase in cost between July 1914, and July, 1919	Increase as related to total budget
<i>All items</i> .....	100.0%		70.8%
Food.....	43.1%	85% <sup>a</sup>	36.6%
Shelter.....	17.7%	28%	5.0%
Clothing.....	13.2%	100%	13.2%
Fuel, heat, and light.....	5.6%	57%	3.2%
Sundries.....	20.4%	63%	12.8%

<sup>a</sup>Based on an increase of 84% up to June 15, 1919, as reported by the United States Bureau of Labor Statistics.

The allocation of expenditures for the different budget items usually varies so little among the families of wage-earners that with any reasonable distribution there would be but slight deviation from the average increase of 71% since 1914. This figure is, therefore, broadly representative of conditions the country over. But it should be emphasized that special local, racial, or other circumstances may at times make necessary some revision to adapt this estimate to meet specific conditions. This is especially true of rents, since changes in this item have at times

differed considerably in separate communities. With the data given, however, such necessary adjustments may be readily computed.

Estimates of changes in the cost of living made by the Board on the basis of retail prices and expenditures for the separate budget items by average families must not be confused with changes in wholesale price index numbers such as Bradstreet's, Dun's, or those of the New York Times *Annalist*. Wholesale commodity prices do not necessarily change concurrently with retail prices and, as already pointed out by the Board they often tend to advance faster than retail quotations. Although valuable as an index of market conditions, commodity prices do not take account of the relative importance of the different items in the family budget. Likewise changes in retail prices of food should not be used as representing changes in the cost of living, since they measure but one item in the budget. The only accurate measure of changes in the cost of living is that based on retail prices weighted according to the proportion of the total budget spent for each item by average families.

More detailed information regarding changes in the cost of the separate budget items is given briefly below. Average retail prices of food as collected by the United States Bureau of Labor Statistics have been accepted by the Board as the best available measure of changes in the cost of this item. For all others, original data were secured by the Board through replies to detailed questionnaires distributed to a large number of retail merchants, real estate brokers, and others in close touch with local conditions in all parts of the country.

#### *Food.*

Average retail prices of food were slightly more than 5% higher on June 15, 1919, than on March 15, 1919, and 84% higher than before the war, on the basis of average prices for the year 1913. The increase within the year ending June 15, 1919, was 14%. These figures cover price changes of 22 articles of food as reported by over 2,000 dealers. Since the Bureau's estimate of 84% increase is for June 15, a slight addition was made by the Board to allow for a possible rise in the last half of the month.

Some of the articles showing the most significant price changes since June, 1918, were onions, the price of which increased 133%; prunes, 53%; coffee, 41%; potatoes, 31%; cheese, 28%; eggs, 26%; butter, 24%; lard, 23%; sugar, 16%; milk, 15%; and flour, 12%. The prices of chuck roast and plate beef decreased 5%, of corn meal, 6%, and of navy beans, 31%. Compared with June, 1913, the average prices of the following articles in June, 1919, were 100% or more higher: sugar, pork chops, ham, bacon, potatoes, corn meal, flour, and lard.

#### *Shelter.*

Reports regarding rent conditions were received from practically all of the cities in the United States having a population of 50,000 or

over, and from a number of smaller places. Of more than 300 statements from persons closely in touch with rents as paid by wage-earners in these separate cities, only one recorded a decrease in this item since March, 1919. In many places rents were still rising, although few pronounced increases were found. Frequently the larger increases reported in July were in those localities where former advances had been least, indicating that the tendency to a leveling of the total increase in rents the country over, which had been evident in March, was still in progress in July. The estimate of 28% as the average rise in rents since 1914 is, therefore, of more general application than that of 22% up to March 1919; of 20% up to November, 1918; or of 15% up to June, 1918, as given in previous reports by the Board. Between March, 1919, and July, 1919 the average increase in rents for the country as a whole was about 5%. These are averages for all sections of the country and reflect a considerable variety of rent conditions.

The opinion was general that rents would continue to rise, since, on account of the abnormally high cost of construction and maintenance, the number of houses being built is inadequate to meet the demand for accommodations. In some places the housing shortage had stimulated popular "own your own home" campaigns and various schemes to assist people to build.

#### *Clothing.*

The advance of 100% in the cost of clothing is larger than that of any other of the major budget items. The average outlay for a family's clothing needs in July, 1919, was 10.5% more than in March, and 3.6% more than in November, 1918, when the previous high peak of clothing prices was reached. Since the summer of 1918, the average cost of clothing had advanced 13%. These increases were obtained by combining the percentages of change in the cost of the separate articles according to their relative importance in the total clothing budget.

Quotations for 29 types of most commonly used yard goods and wearing apparel were secured from 146 dealers in 43 cities. For every article the average price was higher in July, 1919, than in March. As compared with November, 1918, changes varied, but the most important were upward. Cotton and woolen yard goods, overalls, knit and muslin underwear, and the cheaper grades of work shirts, although higher in price than in March, were slightly lower than in November. Prices of yard goods increased more than did prices of made-up garments in the five-year period since 1914, but the cost of women's shoes advanced 131%; women's gloves, 125%; women's knit underwear, 120%; women's coats, 116%; and women's hosiery, 104% between July, 1914, and July 1919. In every case these marked the highest points reached since 1914. Several articles of men's clothing also cost 100% more than before the war.

Dealers very generally expressed the opinion that clothing prices were likely to go still higher.

*Fuel, Heat, and Light.*

No important change in the combined cost of fuel, heat, and light between March and July, 1919, was indicated. While there was a small increase in the cost of anthracite, there was a corresponding decrease in the price of bituminous coal. Prices of other items in this group were practically unchanged. The average increase in the total cost of fuel, heat, and light combined, therefore, is again placed at 57%, as in the March study.

Retail price quotations of anthracite and bituminous coal for household use, secured in July, 1919, from 97 dealers in 43 cities, were analyzed. These showed changes since last March for anthracite varying from a 9% increase in Boston, to a 9% decrease in Charleston, S. C., and an average increase for the country as a whole of 1% to 2%. The total increase since the beginning of the war in 1914 was between 54% and 57%. The increase for bituminous coal within the five-year period was 55%.

Coal dealers were generally of the opinion that the price of anthracite would advance further within the next few months, but there were suggestions that the price of bituminous coal might drop.

Average retail prices of coke and wood fell in a number of cities, but in others they advanced; for the entire country no significant difference was indicated.

Few important changes in the cost of gas and electricity to small consumers between March and July, 1919, were reported, although the tendency of rates was upward.

*Sundries.*

Reports regarding carfare, one of the principal items in the sundries group, were received from 143 cities. In 121 of these there had been no change between March and July, 1919, and in 3 there was a decrease. Such increases as occurred were small. Changes in carfare the country over were, therefore, unimportant. The retail price of tobacco was somewhat higher in July than it had been in March, partly because of increased taxes. The tax on candy, soda water, and ice cream as well as on toilet preparations and drugs also contributed to raise the cost of these items. Household furnishings and supplies were in many instances higher in July than they had been in March. On the other hand, the prices of admission to amusement places, of reading materials, and of doctor's services remained about the same. Postage decreased.

From these separate estimates it appears that there was a small increase in the cost of all sundries combined between March, 1919, and July, 1919. This has been placed at 5%. It must be understood, however, that families vary more in their expenditures for sundries than for any other of the budget items and that no estimated change can be said to be typical. The estimate of 5% increase is based on a wide

variety of combinations and is as representative of the change that has occurred as any that can be reached. This brings the total increase in the cost of sundries since 1914 to 63% as contrasted with 55% in March, 1919, and November, 1918, and 50% in June, 1918.

*The Complete Budget.*

A summary of changes in the cost of living as determined in the four surveys made by the National Industrial Conference Board is given in the table below.

Talbe

INCREASE IN THE COST OF LIVING FOR WAGE-EARNERS IN AVERAGE AMERICA COMMUNITIES, BETWEEN JULY 1914 AND JULY 1919, BY SEPARATE BUDGET ITEMS.

Budget items	July, 1914, to June, 1918	July, 1914, to Novem- ber, 1918.	July, 1914, to March 1919	July, 1914 to July, 1919
<i>All items</i> .....	<u>52.3%</u>	<u>65.9%</u>	<u>61.3%</u>	<u>70.8%</u>
Food.....	62%	83%	75%	85% <sup>a</sup>
Shelter.....	15%	20%	22%	28%
Clothing.....	77%	93%	81%	100%
Fuel, heat, and light.....	45%	55%	57%	57%
Sundries.....	50%	55%	55%	63%

<sup>a</sup> Based on an increase of 84% up to June 15, 1919, as reported by the United States Bureau of Labor Statistics.

A complete report containing the evidence from which these conclusions were drawn will be issued by the Board within a few weeks. This will be the fourth of a series on this subject.

## Chapter 3.

## RETAIL PRICES OF FOOD.

The only authoritative data on retail food prices in the United States are those collected by the U. S. Bureau of Labor Statistics and published currently in the Monthly Labor Review of that Bureau. These price reports for a considerable period of time have been for at least 22 principal food articles, obtained from some 2000 dealers in 45 cities of the United States, so distributed geographically as to be representative of the whole country. Recently the number of commodities and the number of cities covered by the study has been considerably extended.

*Index Numbers of Retail Food Prices of All Commodities, by Months,  
January, 1913 to July, 1919.*

The following table gives by months from January 1913 to July 1919, the index numbers of retail food prices of all the commodities for all cities for which data were obtained by the U. S. Bureau of Labor Statistics for this period. The average of the prices for the year 1913 is taken as a base of 100.

TABLE 10.

RELATIVE RETAIL PRICES OF FOOD IN THE UNITED STATES JANUARY 1913 TO JUNE 15, 1919 INCLUSIVE.

(Compiled from Monthly Labor Reviews of U. S. Bureau of Labor Statistics).

*Actual Retail Prices of Food on July 15 of Each Year, 1913 to July 1919.*

The actual retail prices of a long list of food articles for July 15, 1913, 1914, 1917 and 1919 are given in the next table together with the per cent of increase or decrease July 15 of each specified year compared with July 15, 1913. Prices for certain of the articles are not available for the whole period, but the totals are sufficient to be representative.

TABLE 12.

## Food Prices and Costs in 1913 and 1919 in 39 Cities.

A series of tables of very great interest, showing comparative food prices in 39 cities in 1913 and in June 1919, was submitted by the United States Bureau of Labor Statistics to the U. S. Senate Subcommittee of the District of Columbia Committee at its hearing on high prices and profiteering in September 1919.

These tabulations are reproduced below, substantially in full. The cities, it will be noted are listed, for each food article, in parallel columns,

first according to their price ranking in 1913 and then according to their price ranking in June 1919. In addition a similar ranking is made according to combined food prices. This combination was made by computing the cost of a standard food budget (based on the average consumption of a large group of families) for each city according to the prices then prevailing.

In submitting these figures the Bureau emphasized the fact that comparisons between cities as regards food prices cannot be exact owing to the great difficulty in certain cases of obtaining prices for precisely the same grade of article in different places. Again the Bureau points out in the Monthly Labor Review for September 1919 that:

"1. In Boston, Mass.; Fall River, Mass.; Manchester, N. H.; New Haven, Conn. Portland, Me.; and Providence, R. I., very little fresh plate beef is sold, and prices are not secured from these cities for this article.

"2. The cut of beef known as "sirloin" in Boston, Mass.; Manchester, N. H.; Philadelphia, Pa.; and Providence, R. I., would be known as "porterhouse" in other cities. In these four cities, owing to the method of dividing the round from the loin, there is no cut that corresponds to "sirloin" in other cities. There is also a greater amount of trimming demanded by the trade in these cities.

"3. The most of the sales in Newark, N. J., are on whole ham instead of the sliced as in other cities."

Thus it is evident that exact comparisons can not be made between cities, without taking these and other facts relative to local customs into consideration. Nevertheless the figures do represent a trend in the retail cost of these articles to the average family in each individual city.

## CHANGES IN COST OF LIVING.

26

TABLE 13.

Total cost of a Standard Year's Supply of 22 Principal Articles of Food in 39 Cities at prices prevailing in June 1919 and at average Prices for the Year 1913.  
 (In this table the standard supply of each article is assumed to be the same in each city. The table, therefore, indicates the change in price levels rather than in cost of living with its local variations in the amount of each article consumed).

## Chapter 4.

### RETAIL PRICES OF DRYGOODS.

Lack of standardization of trade names and qualities makes it unpracticable to obtain price charges for very many articles of dry goods. The U. S. Bureau of Labor Statistics publishes from time to time in its Monthly Labor Review prices on a limited number of articles for various cities.

The most effective presentation of this data however is contained in the report submitted by the Bureau to the Subcommittee of the Senate Committee on the District of Columbia, at its hearings on high prices and profiteering in September 1919. This report upon the prices of drygoods in 39 cities in May 1915 and May 1919, was submitted in the same form as the report on food prices presented in the preceding chapter. The report on dry goods covers gingham, 27 inches, sheeting bleached, 9-4, and muslin bleached, and gives in parallel columns the prices in 1915 and 1919, for each of 39 cities. The original tabulations are presented almost in full in Tables 28, 29 and 30.

The average prices of the three articles for all 39 cities are shown by the tables to be as follows:

	Average price May 1915	Average price May 1919	Per cent increase 1919 over 1915
Gingham, 27 inch.....	11.95	31.9	166.95
Sheeting, bleached, 9-4.....	31.4	74.0	135.7
Muslin, bleached.....	10.7	27.9	160.7

These articles are too few in number to permit the drawing therefrom of conclusive results regarding price changes in dry goods as a class, but the uniformity of movement among these three is highly suggestive of the general tendency.

**Chapter 5.****RETAIL PRICES OF FUEL AND LIGHT.****COAL**

The Monthly Labor Review of the United States Bureau of Labor Statistics for September 1919 contains detailed data regarding the retail prices of coal on January 15 and July 15 of each year 1913 to 1919 inclusive. The prices shown for bituminous coal are averages made on the several kinds, the coal dealers in each city being asked to quote prices on the kind usually sold for household use. The prices quoted are for coal delivered to consumers but do not cover charges for storing in cellar or coal bin where extra handling is necessary. Coal prices were obtained only for those cities in which the Bureau obtains food prices.

The following table (Table 31) summarizes the data referred to. It gives by cities the average retail price of one size of anthracite(stove) and of bituminous coal for January and July 1913, and for January and July 1919. These abbreviated data are sufficient to show the trend of prices.

## CHANGES IN COST OF LIVING.

## Chapter 6.

### WHOLESALE PRICES.

Wholesale price index numbers have been compiled and published for a number of years by various organizations. The best known of these index numbers are those of the U. S. Bureau of Labor Statistics, The Annalist, Bradstreet, Dun, and Gibson. These are all built upon the same general principle--namely the averaging of the wholesale prices of various commodities (in some cases weighted prices) and expressing all changes in terms of some one year taken as a base.

They differ widely, however, as regards the selection of commodities and their system of weighting. The series compiled by the Bureau of Labor Statistics includes at the present time articles or grades of articles divided into farm products, foods, cloths and clothing, fuel and lighting, metals and metal products, lumber and building materials, chemicals and drugs, house-furnishings and miscellaneous commodities. The Annalist series comprises 25 food articles. Bradstreet's index includes 96 commodities classed as bread-stuffs, livestock, provisions and groceries, fresh and dried fruits, hides and leather, raw and manufactured textiles, metals, coal and coke, mineral and vegetable oils, naval stores, building materials, chemicals and drugs, and miscellaneous. Dun's index contains 200 commodities divided into breadstuffs, meats, dairy and garden products, other foods, clothing, metals and miscellaneous. The index issued by Thomas Gibson includes only 22 foodstuffs.

In the following table the five series of wholesale price index numbers noted are brought into comparison for selected dates from 1913 to 1919. The base in each case has been shifted to the same year, 1913, by dividing the index for 1913 in the original base into the original index for each subsequent year or month. The table up to March, 1919 is summarized from the *Monthly Labor Review* of the U. S. Bureau of Labor Statistics for June, 1919, and corrected for the U. S. Bureau of Labor Statistics' scale to conform with the revision recently announced by the Bureau. For months later than March, 1919, the necessary data for the other index numbers has been obtained from the original sources.

*Wholesale Price Index Numbers for Selected Groups of Commodities.*

The wholesale price index numbers of the U. S. Bureau of Labor Statistics have been recently revised to include a number of important commodities not previously included. As now constituted the index number series includes quotations for 326 commodities, the largest number covered by any of the index number series. The index numbers as published by the Bureau are divided into nine main groups--farm products, food, clothes and clothing, fuel and lighting, metals and metal products, lumber and building materials, drugs and chemicals, house furnishings and miscellaneous. These index numbers by commodity groups offer an excellent indication of the trend of wholesale prices of the more important commodities during recent years. The following table gives these data in detail for selected dates from 1913 to July 1919.

## CHANGES IN COST OF LIVING.

TABLE 35.

## Money Prices of Certain Articles at Wholesale July 1914 to June 1919.

The average money prices of certain important articles at wholesale for July of each year 1914 to 1918 and for June 1919 are shown in the table below. This is a summary of the more detailed data published in the Monthly Labor Review of the U. S. Bureau of Labor Statistics for August 1919.

TABLE 36.

WHOLESALE PRICES IN JULY 1914, 1915, 1916, 1917 AND 1918 AND IN JUNE 1919.

Article	Unit.	July					June 1919		
		1914	1915	1916	1917	1918
